Preventative Maintenance Software Installations

LouisDreyfus

Louis Dreyfus has installed Comco's web-based preventative maintenance software system at all 10 of their Western Canadian facilities!

"The simplicity of the ComGuard System is enabling users of many different abilities to maintain equipment and build meaningful history."

- Dave Barrett—Facilities Operations Manager, Louis Dreyfus Canada Ltd.

"I have used ComGuard to efficiently build a maintenance history of all areas of our plant. I now have the ability to forecast upcoming repairs by referring to past completed maintenance."

- Ray Baumann—Territory Manager, Aberdeen SK, Louis Dreyfus Canada Ltd.

Summary

10 sites in western Canada now house the ComGuard Integrated Maintenance software system.

This **easy to use** web based software system is tied to facility equipment providing the means to plan maintenance schedules around actual equipment usage.

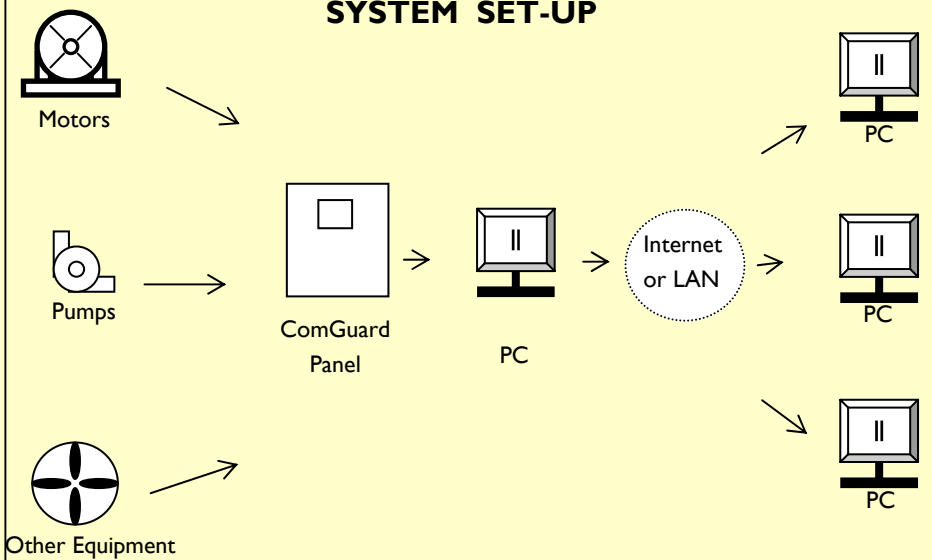

The web based software allows all users (with the proper log-in credentials) the **convenience** of being able to log on to the software from anywhere there is internet access.

With special access, the remote head office managers can view all 10 sites in a "dashboard" type of layout from the comfort of their own office or anywhere they have internet access **saving time & travel**.

The history log provides a means of tracking who performed the maintenance task and when. This data is also used to determine how much a device is actually costing to maintain over time.

Easily link to supplier information, web pages, instruction manuals, facility layouts blueprints, etc.

SYSTEM SET-UP

CRITICAL EQUIPMENT

Hardwired or wireless connection panel enabling run-time information to be automatically recorded, such as starts/stops, total run time, run time since last maintenance, etc.

NON CRITICAL EQUIPMENT

Simply entered into the database for time-based maintenance alerts. (Ex: once per day, week, month...)
